Hiring Team

August 10, 2026

Dear Sir or Madam,

I am a Senior Data Scientist and AI Engineer with 14 years of professional experience, including 11 in machine learning and artificial intelligence, and I am very interested in the position at your company. I currently work at ELCA Informatique SA in Zurich, and previously at Mercedes-Benz Mobility AG in Stuttgart, delivering production systems built on large language models, retrieval and semantic search.

Recent projects include:

- **Internal multilingual staff assistant** (leading Swiss collection agency, ELCA, current): answers grounded strictly in a corpus of official work-instruction manuals, in German, French and Italian. I replaced an LLM-driven catalogue-browsing design with a dedicated search engine, cutting both latency and cost per question by a large margin, and designed multimodal retrieval that surfaces the manuals' own screenshots without a vision model. Chainlit, OpenSearch, LiteLLM, Qwen3.
- **Sovereign, self-hosted GenAI platform** (Canton of St. Gallen, ELCA, current): purpose-specific assistants for writing, research and summarisation, handling documents classified confidential and secret on hardware inside the cantonal data centre. I designed the prompt architecture, compressing large official rule sets into stable, cacheable system prompts after measuring three alternatives against each other. Open WebUI, Bifrost, vLLM, Gemma.
- **Semantic query and fraud reasoning** (Mercedes-Benz Mobility and Mercedes-Benz Bank, past): a system letting collections staff identify high-risk customers in natural language, using Model Context Protocol to translate intent into weighted SQL and vector queries across risk history, payment profiles and behavioural data; and a separate fraud-reasoning system surfacing abnormal credit applications, clustering historical fraud patterns with FAISS.
- **Forecasting and reinforcement learning** (Lufthansa Industry Solutions, past): a forecasting platform with rolling predictions, automated retraining and Bayesian hyperparameter optimisation, and resource-allocation and scheduling problems modelled as reinforcement-learning tasks.

Alongside the systems themselves I build the evaluation frameworks that make them measurable, combining deterministic rule metrics with LLM-as-judge pipelines and retrieval-versus-generation failure attribution, together with the guardrails and data-protection controls such systems need in regulated environments.

With experience delivering complex AI projects across finance, automotive, aviation, construction and the public sector, I am confident I can contribute innovative and scalable solutions to your teams. I would be glad to discuss my qualifications and motivation in a personal interview.

Sincerely,

Raghuram Kalyanam
